To create a cryptocurrency token via an on-chain AI launcher (such as Clanker on Base/Warpcast) or a framework like Virtuals Protocol, you can deploy an agent named "me too" ($METOO) with a single command or social post.

Steps to Deploy via a Social AI Launcher

- **Get a Web3 Wallet:** Set up an ETH wallet and fund it with small amounts of Ethereum on the Base network for gas fees.
- **Connect to the Platform:** Open a supported social app like Warpcast or an agent factory interface.
- **Tag the Agent:** Tag or prompt the deployment bot (e.g., `@clanker`) in a post or reply.
- **Provide Token Details:** Specify the name `me too`, ticker symbol `$METOO`, and optionally attach an image.
- **Confirm Creation:** Submit the deployment command to instantly launch the token and create the automated liquidity pool (LP) pair.

If you meant building a custom code/software AI agent instead of a crypto token, let me know:

- Which **framework** you prefer (e.g., ElizaOS, Virtuals, or a standard Python/Node.js script)
- Which **blockchain or platform** (Base, Solana, Telegram, Twitter/X) you want it on
